Experience-Dependent Plasticity in Reward Circuits

Biography

The lab is newly renovated and up-and-running with state-of-the-art equipment and passionate investigators!

We are actively recruiting highly motivated investigators at the PhD and Postdoc level.

Research

We study how the nervous system encodes experience. Our main model system addresses the development of the response to cocaine experience. Our uniquely multidisciplinary applies knowledge gained from studying the principles of dynamic gene regulation to investigation of neural circuit organization underlying the development of addictive behaviors. Understanding the mechanisms defining neural circuit organization in addiction will lead to unique insight into how the brain encodes experience and is expected to impact the treatment of psychiatric disorders.
