 Egyptians have long been fascinated with the idea of immortality. Even in ancient times, they believed that a person's soul could exist after death, and they sought ways to preserve their physical remains for eternity. One of the most famous examples of this belief is the construction of the pyramids, which served as royal tombs.

The pyramids were built using a technique known as the "true" pyramid, which consists of a series of rectangular stone blocks stacked on top of each other to form a pyramid-like structure. The largest of these structures, the Great Pyramid of Giza, stands 146.6 meters (481 feet) tall and was completed around 2560 BC.

In addition to the pyramids, ancient Egyptians also believed in the existence of a spiritual realm called the Duat, where the souls of the deceased would travel after death. They believed that by performing the proper rituals and offering sacrifices to the gods, the soul could enter the Duat and receive an eternal afterlife.

The ancient Egyptians also believed in the concept of mummification, which involved preserving the body of a deceased person through the use of embalming techniques such as drying, bandaging, and the insertion of various materials into the body. This process allowed the deceased to remain physically intact for a period of time, and was believed to facilitate their journey into the afterlife.

Despite the passage of time, the belief in immortality remains a central theme in many cultures around the world. Whether through the construction of monumental structures or the preservation of physical remains, people have sought ways to ensure their existence beyond death.
It is now widely accepted that deciphering the enigma of the brain is the most challenging intellectual endeavor of the 21st century, "The Century of the Brain" - Join our quest and become a friend of ELSC.

Our Int'l Ph.D. program provides outstanding students with top-notch courses in computational neuroscience.

The Jerusalem Brain Sciences Building will provide a state-of-the-art research and teaching facility for the Edmond and Lily Safra Center for Brain Sciences.
